MEMORANDUM

To:	Nancy Chung, Los Angeles Department of Water and Power
From:	Sabita Tewani, AICP, Transportation Planner
Subject:	Construction Traffic Analysis Memorandum for Valley Generating Station Demolition Project
Date:	October 15, 2020
cc:	Dennis Pascua, Dudek Rachel Struglia, Dudek
Attachment(s):	Figures 1–9 Attachment A, Traffic Counts, CMA Worksheets, Synchro Worksheets, Construction Schedule and Phasing

This memorandum provides a Construction Traffic Analysis of the roadway network identified in the project area of the proposed Valley Generation Station Demolition Project (project). The analysis conducted by Dudek is included only for informational purposes.

The Los Angeles Department of Water and Power proposes to demolish Units 1–4 and associated structures and systems within the Valley Generating Station (VGS). The project site is located is located at 11801 Sheldon Street within the VGS in the City of Los Angeles in the San Fernando Valley region of the County of Los Angeles. Generally, the VGS is in the northeastern portion of the City of Los Angeles in the Sun Valley neighborhood, approximately 1 mile northeast of the Interstate (I) 5 and State Route 170 intersection.

Main access to the VGS is provided from Sheldon Street, which forms the southern site boundary. Old San Fernando Road has secondary access driveways into the VGS and forms the western site boundary. Worker and truck traffic related to the proposed project would use the access along Old San Fernando Road and Sheldon Street; however, recommendations for use of alternate access during peak construction period have been provided in this memorandum.

Study Area

The project proposes to demolish structures and systems on the Los Angeles Department of Water and Power VGS Units 1–4 on its site located at 11801 Sheldon Street in the City of Los Angeles. Figure 1, Project Site Location and Study Area, shows the project site location and study area. The study area for the traffic analysis includes the intersections most likely to be used by the proposed project, as follows:

1. Glenoaks Boulevard/Branford Street (signalized)
2. Glenoaks Boulevard/Sheldon Street (signalized)
3. Glenoaks Boulevard/Tuxford Street – La Tuna Canyon Road (signalized)
4. San Fernando Road/Sheldon Street (signalized)
5. San Fernando Road/Lankershim Boulevard (signalized)

6. I-5 northbound on ramp/Rincon Avenue/Sheldon Street
7. Laurel Canyon Boulevard/Sheldon Street (signalized)
8. I-5 northbound off ramp-Jerome Street/Laurel Canyon Boulevard
9. I-5 southbound ramps/Laurel Canyon Boulevard
10. I-5 northbound ramps/Lankershim Boulevard (signalized)
11. I-5 southbound ramps/Lankershim Boulevard (signalized)

The project setting was developed by reviewing the existing transportation network in the project vicinity. This review was supplemented with traffic counts collected in September 2019. Trip generation during the Peak Construction Year period was analyzed to determine project-level effects to the transportation network. Worker, vendor truck, and haul truck trips were calculated for each phase of the proposed construction schedule to identify the Peak Construction Year period. The Peak Construction Year period analyzes the scenario during which the maximum total daily trips are generated. The information review also included review of intersection analysis methodologies for analyzing effects to the intersections identified in the study area.

Intersection Analysis Methodology

Per LADOT Traffic Impact Study Guidelines (2016) the intersection evaluation methodology for development projects is based on the Transportation Research Board, Circular 212 Critical Movement Analysis (CMA) Planning Method for analyzing traffic operating conditions at study intersections. CMA is a method that determines the volume-to-capacity (V/C) ratio on a critical lane basis and the level of service (LOS) associated with each V/C ratio at an intersection. The intersections within LADOT jurisdiction were analyzed using the CMA methodology.

The intersection evaluation methodology for transportation infrastructure projects is based on the Highway Capacity Manual (HCM) methodology for analyzing traffic operating conditions at study intersections. HCM is a method that determines the average control delay per vehicle (in seconds) and the LOS associated with vehicle delays at an intersection. Per Caltrans requirements, the ramp intersections with I-5 in the study area were analyzed using the HCM methodology.

The operational characteristics of an intersection are also determined by calculating the intersection's LOS. The intersection as a whole and its individual turning movements can be described alphabetically with a range of levels of service (A through F), with LOS A indicating free-flow traffic and LOS F indicating extreme congestion and long vehicle delays. Caltrans and LADOT (for transportation infrastructure projects) utilize the HCM delay-based methodology to assess transportation effects on intersections. Table 1 provides a description of the different LOS performance measures and associated terms of delay per vehicle.

Table 1. Level of Service Definitions for Signalized Intersections

Level of Service	Volume/Capacity Ratio	Delay per Vehicle (seconds per vehicle)	General Description
A	≤0.600	≤10	Free flow
B	0.601 to ≤0.700	>10–20	Stable flow (slight delays)
C	0.701 to ≤0.800	>20–35	Stable flow (acceptable delays)

Table 1. Level of Service Definitions for Signalized Intersections

Level of Service	Volume/Capacity Ratio	Delay per Vehicle (seconds per vehicle)	General Description
D	0.801 to ≤0.900	>35–55	Approaching unstable flow (tolerable delay, occasionally wait through more than one signal cycle before proceeding)
E	0.901 to ≤1.00	>55–80	Unstable flow (intolerable delay)
F	>1.00	>80	Forced flow (jammed)

Caltrans

In the study area, the I-5 facility and its ramp intersections with Laurel Canyon Boulevard and Lankershim Boulevard are under Caltrans jurisdiction. Per Caltrans Guide for the Preparation of Traffic Impact Studies (2002), the LOS for operating State highway facilities is based upon measures of effectiveness (MOEs). These MOEs describe the measures best suited for analyzing State highway facilities (i.e., freeway segments, signalized intersections, on- or off-ramps, etc.). Caltrans endeavors to maintain a target LOS at the transition between LOS C and LOS D on State highway facilities; however, Caltrans acknowledges that this may not always be feasible and if an existing State highway facility is operating at less than the appropriate target LOS, the existing MOE should be maintained. Caltrans guidelines recommend utilizing HCM methodology for freeway segments and ramps. Therefore, Caltrans facilities were analyzed using the HCM methodology.

Existing Conditions

Figure 2, Existing Traffic Control and Geometrics, shows the study area intersections and indicates their existing traffic controls and geometrics. Characteristics of the existing street system in the study area are shown in Table 2.

Table 2. Study Area Existing Street System Summary

Roadway	Street Classification	Posted Speed Limit (mph)	No. of Travel Lanes	Parking	Sidewalks	Existing Bicycle Lanes
Glenoaks Boulevard	Boulevard II	50	4 lanes with center turn lane	Some sections/Time restrictions	Yes	Yes
San Fernando Road	Avenue I	35	4 lanes	Some sections	Yes (along eastern side of the street)	No
Sheldon Street	Avenue II	40	4 lanes with center turn lane	Some sections	Yes	No

Source: LADCP 2017.

Transit Network

The Los Angeles County Metropolitan Transportation Authority (LA Metro) provides transit service in the area.

LA Metro Routes 794 and 94 operate along San Fernando Road and connect Downtown LA with Sylmar Station and Downtown LA with Sun Valley, respectively. The service is available approximately every 20 minutes on both routes. The Route 94 operates on all weekdays and weekends and Route 794 operates only on weekdays. Route 224 operates along San Fernando Road and connects Studio City Station with Olive View Medical Center in Sylmar. The service is available approximately every 25 minutes. The Route 224 operates on all weekdays and weekends.

LA Metro Route 166/364 operates along Glenoaks Boulevard and connects Chatsworth Station with Sun Valley. The service is available approximately at an interval of 15-20 minutes. The Route 166/364 operates on all weekdays while Route 166 operates on weekends and holidays.

Existing Traffic Volumes

Existing peak hour turn movement counts at the study intersections were conducted in September 2019. Worksheets for the raw peak hour turn movement counts in the LADOT format are provided as an attachment to this memo. Figure 3, Existing Traffic Volumes, shows the Existing AM and PM peak hour traffic volumes.

Existing Levels of Service

An intersection LOS analysis was prepared for the Existing conditions using the CMA and HCM methodologies, and Table 3 shows the results of the existing weekday peak hour LOS analysis. Worksheets for the LOS analysis are provided as an attachment to this memo.

Table 3. Existing (2019) Peak Hour Intersection Level of Service

No.	Intersection	Control Type	LOS Method	AM Peak		PM Peak	
				V/C [1] /Delay[2]	LOS	V/C [1] /Delay[2]	LOS

11.	I-5 SB ramps/Lankershim Boulevard	signalized	CMA HCM	0.445 17.8	A B	0.385 13.3	A B

Notes: LOS = level of service; V/C = volume to capacity; CMA = LADOT CMA Methodology; I = Interstate; HCM = HCM Methodology (for Caltrans facilities); NB = Northbound; SB = Southbound.

1 Volume-to-Capacity (V/C) ratio.

2 Delay is calculated in seconds per vehicle.

Per LADOT methodology, as shown in the table, most of the study area intersections are currently operating at LOS D or better under existing conditions, except for the following:

- **Intersection No. 8:** I-5 northbound off- ramp- Jerome Street/Laurel Canyon Boulevard operates at LOS E during the PM peak hour;
- **Intersection No. 9:** I-5 southbound ramps/Laurel Canyon Boulevard operates at LOS E during the PM peak hour.

Per HCM methodology utilized for Caltrans facilities, the following intersections operate at LOS E or F under existing conditions:

- **Intersection No. 6**: I-5 northbound on ramp/Rincon Avenue/Sheldon Street operates at LOS F and E during the AM and PM peak hour, respectively;
- **Intersection No. 8:** I-5: northbound off- ramp- Jerome Street/Laurel Canyon Boulevard intersection operates at LOS F during both the AM and PM peak hours;
- **Intersection No. 9:** I-5 southbound ramps/Laurel Canyon Boulevard operates at LOS F during both the AM and PM peak hours.

Peak Construction Year Conditions

Per the project's construction schedule (exact dates are tentative), peak phase of construction activities which would contain the highest volumes of construction traffic (i.e., a total of workers and trucks) related to the demolition activities on the proposed project site was identified. It is anticipated that peak construction phase would correspond to the year 2023.

Peak Construction Year Traffic Volumes

Peak Construction Year Baseline traffic volumes include traffic from ambient growth, and traffic from the addition of cumulative projects in the vicinity of the project. A growth rate of 0.50% per year, provided in the "General Traffic

Volume Growth Factors" (from the respective Regional Statistical Area No. 13 and No. 14) found in Exhibit D-1 of the Los Angeles County Congestion Management Program (Metro 2010) was applied to the existing traffic volumes to account for the year 2023 Peak Construction Year timeframe. A list of cumulative projects cumulative (approved/pending but not yet constructed) from the Department of City Planning (LADCP 2019), Case Reports, was reviewed, however no projects were identified that would add traffic to the project study area. Figure 4, Peak Construction Year Traffic Volumes, shows the Peak Construction Year AM and PM peak hour traffic volumes.

Peak Construction Year Levels of Service

An intersection LOS analysis was prepared for the Peak Construction Year 2023 traffic volumes using the CMA and HCM methodologies, and Table 4 shows the results of the Peak Construction Year Baseline peak hour LOS analysis. Worksheets for the LOS analysis are provided in as an attachment to this memo.

Table 4. Peak Construction Year Peak Hour Intersection Level of Service

No.	Intersection	Control Type	LOS Method	AM Peak		PM Peak	
				V/C [1] /Delay[2]	LOS	V/C [1] /Delay[2]	LOS
1.	Glenoaks Boulevard/Branford	signalized	CMA	0.596	A	0.641	B
2.	Glenoaks Boulevard/Sheldon	signalized	CMA	0.523	A	0.617	B
3.	Glenoaks Boulevard/Tuxford Street – La Tuna Canyon Road	signalized	CMA	0.792	C	0.685	B

10.	I-5 NB ramps/Lankershim Boulevard	signalized	CMA HCM	0.517 19.2	A B	0.447 15.9	A B
11.	I-5 SB ramps/Lankershim Boulevard	signalized	CMA HCM	0.456 19.8	A B	0.395 13.4	A B

Notes: LOS = level of service; V/C = volume to capacity; CMA = LADOT CMA Methodology; I = Interstate; NB = Northbound; HCM = HCM Methodology (for Caltrans facilities); SB = Southbound.

[1] Volume-to-Capacity (V/C) ratio.

[2] Delay is calculated in seconds per vehicle.

Per LADOT methodology, as shown in the table, most of the study area intersections are currently operating at LOS D or better under peak construction year 2023, except for the following:

- **Intersection No. 8:** I-5 northbound off- ramp- Jerome Street/Laurel Canyon Boulevard operates at LOS E during the PM peak hour;
- **Intersection No. 9:** I-5 southbound ramps/Laurel Canyon Boulevard operates at LOS E during the PM peak hour.

Per HCM methodology utilized for Caltrans facilities, the following intersections operate at LOS E or F under peak construction year 2023 conditions:

- **Intersection No. 6:** I-5 northbound on ramp/Rincon Avenue/Sheldon Street operates at LOS F and E during the AM and PM peak hour, respectively;
- **Intersection No. 8:** I-5 northbound off- ramp- Jerome Street/Laurel Canyon Boulevard intersection operates at LOS F during both the AM and PM peak hours;
- **Intersection No. 9:** I-5 southbound ramps/Laurel Canyon Boulevard operates intersection operates at LOS F during both the AM and PM peak hours.

Trip Generation

The Institute of Transportation Engineers' *Trip Generation* manual (ITE 2017) does not contain trip rates for the construction-related activities; therefore, project's general construction phasing and schedule was utilized to estimate the proposed project's construction traffic generation. Based on the estimated average number of workers, vendor, and haul truck trips across the various phases and months of the proposed project, the Peak Construction Year period was identified. During this Peak Construction Year period (demolition activities), the maximum number of daily on-site workers would be 112 workers and the maximum number of trucks would be 1 vendor truck and 14 haul trucks.

Based on the construction hour, most workers would likely arrive at the construction site before 6:00 a.m. and leave after 3:00 p.m. Therefore, approximately 90% of the workers were assumed to arrive before the AM peak hour, and a same percentage was assumed to depart during the peak hours. The daily off-site truck trips would generally be distributed throughout the work day. Based on these assumptions, Table 5 provides projects' trip generation for the Peak Construction Year phase.

Table 5. Peak Construction Trip Generation

Vehicle Type	Daily Quantity	Daily Trips	AM Peak Hour			PM Peak Hour		
			In	Out	Total	In	Out	Total
Trip Generation								
Workers[1]	112 workers	224	11	0	11	0	101	101
Vendor Trucks[2]	1 truck	2	1	0	1	0	1	1
Haul Trucks[3]	14 trucks	28	2	2	4	2	2	4
	Total	**254**	**14**	**2**	**16**	**2**	**104**	**106**
Trip Generation with PCE								
Workers (1.0 PCE)	112 workers	224	11	0	11	0	101	101

Table 5. Peak Construction Trip Generation

Vehicle Type	Daily Quantity	Daily Trips	AM Peak Hour			PM Peak Hour		
			In	Out	Total	In	Out	Total
Vendor Trucks (2.0 PCE)	1 truck	4	2	0	2	0	2	2
Haul Trucks (3.0 PCE)	14 trucks	84	6	6	12	6	6	12
Total (with PCE)		**312**	**19**	**6**	**25**	**6**	**109**	**115**

Note: PCE = passenger car equivalent.

1 Workers are assumed to utilize passenger cars and no carpooling is assumed. Based on working hours 6:00 a.m. to 3:00 p.m., approximately 10% of the workers are assumed to arrive during the AM and 90% depart during the PM peak hour.

2 Vendor trucks are assumed to be distributed evenly across the 8-hour work shift to estimate AM and PM peak hour trips.

3 Haul truck trips are distributed evenly over the duration of construction phase to estimate daily haul truck trips and across the 8-hour work shift to estimate AM and PM peak hour trips.

As shown in Table 5, the project would generate approximately 254 daily trips, 16 AM peak hour trips (2 inbound and 14 outbound), and 106 PM peak hour trips (2 inbound and 104 outbound). With the application of a passenger-car-equivalent factor to truck trips, the proposed project would generate approximately 312 passenger-car-equivalent daily trips, 25 passenger-car-equivalent AM peak hour trips (19 inbound and 6 outbound), and 115 passenger-car-equivalent PM peak hour trips (6 inbound and 109 outbound).

Trip Distribution and Assignment

Temporary staging and laydown areas for construction materials and equipment, as well as parking for construction workers would be accommodated within the project site. Worker and employee vehicle parking would also be accommodated within the project site for most of the construction duration. Construction traffic was distributed to the study area intersections and roadway segments based on logical commute routes for workers, and the nearest freeway access with truck routes for construction-related trucks. Construction related trips were assigned to the study area intersections by applying the project trip generation estimates to the trip distribution percentages at each study area intersection and roadway segments.

Worker traffic is anticipated to access the project site via Old San Fernando Road and Sheldon Street (full access). The truck traffic would not be routed to the project site via the San Fernando Road/Sheldon Street intersection. This intersection does not allow adequate storage length that would be needed for trucks to make an eastbound left turn at the rail road crossing of San Fernando Road/Sheldon Street in order to turn onto Old San Fernando Road. Therefore, the trucks would be routed to access the project site via the Glenoaks Boulevard/Sheldon Street intersection. All truck traffic will likely enter the study area from I-5 and use the interchanges at Tuxford Street and Sunland Boulevard. A number of landfill and recycling sites are located within 2 or 3 miles of the project site. Therefore, the trucks from the project site would be hauling material to those sites. The project trip distribution and assignment for workers is shown in Figure 5, Project Trip Distribution and Assignment-Workers, while the project trip distribution and assignment for trucks is shown in Figure 6, Project Trip Distribution and Assignment-Trucks. Figure 7, Total Project Trip Assignment, shows the total project trip assignments, at the study area intersections.

Construction Traffic Analysis

Traffic effects due to construction of the proposed project under the Existing plus Project and Peak Construction Year plus Project conditions were forecast by adding project traffic volumes to the existing traffic volumes and the Peak Construction Year traffic volumes, respectively.

Existing plus Project Conditions

The project trip assignments shown in Figure 7 for construction-related project traffic (workers and trucks), were added to the existing traffic volumes shown in Figure 3 to derive the Existing plus Project traffic volumes. Figure 8, Existing Plus Project Traffic Volumes, illustrates the Existing plus Project traffic volumes that were used to evaluate the Existing plus Project traffic conditions. An intersection LOS analysis was conducted using the CMA and HCM methodologies, and Table 6 shows the results. Worksheets for the LOS analysis are provided as an attachment to this memo.

Therefore, as shown in Table 6, the addition of project traffic would contribute to existing operational deficiency at the following intersections:

- **Intersection No. 6:** I-5 northbound on ramp-Rincon Avenue/Sheldon Street operates at LOS F during the AM and the PM peak hours;
- **Intersection No. 8:** I-5 northbound off ramp-Jerome Street/Laurel Canyon Boulevard operates at LOS F during the AM and the PM peak hours;
- **Intersection 9:** I-5 southbound ramps/Laurel Canyon Boulevard: operates at LOS F during the AM and the PM peak hours.

Peak Construction Year plus Project Conditions

The project trip assignments shown in Figure 7 for construction-related project traffic (workers and trucks) were added to the peak construction year traffic volumes shown in Figure 4 to derive the Peak Construction Year plus Project traffic volumes. Figure 9, Peak Construction Year Plus Project Traffic Volumes, illustrates Peak Construction Year plus Project traffic volumes that were used to evaluate the Peak Construction Year 2023 plus Project traffic conditions. An intersection LOS analysis was conducted using the CMA and HCM methodologies, and Table 7 shows the results. Worksheets for the LOS analysis are provided as an attachment to this memo.

Therefore, as shown in Table 7, the addition of project traffic would contribute to existing operational deficiency at the following intersections:

- **Intersection No. 6:** I-5 northbound on ramp-Rincon Avenue/Sheldon Street operates at LOS F during the AM and the PM peak hour;
- **Intersection No. 8**: I-5 northbound off ramp-Jerome Street/Laurel Canyon Boulevard operates at LOS F during the AM and the PM peak hours;
- **Intersection No. 9**: I-5 southbound ramps/Laurel Canyon Boulevard: operates at LOS F during the AM and the PM peak hours.

In order to reduce the project traffic that would add to the operational deficiency during the PM peak hour (i.e., when the workers would depart from the proposed project) during peak construction period, **PDF-TRAF-1: Use of Alternate Project Access** would be implemented.

Improvement Measure

The following measure is recommended to address the (temporary) traffic effects of the proposed project at the study area intersections:

PDF-TRAF-1 **Use of Alternate Project Access**: For the duration of peak construction phase (anticipated to occur during the overlap of construction phases with demolition of Units 3 and 4), the project Construction Manager/Contractor shall allow the construction-related worker traffic to use an alternate exit (Main Gate) from the site located along Sheldon Street, during the PM peak hour. The Contractor shall install a sign prohibiting right turn out of the Main Gate along Sheldon Street to ensure that the outbound traffic turns left and travels east along Sheldon Street during the PM peak hour (3:00 p.m.–6:00 p.m.) With fewer workers being allowed to utilize an alternate exit during the PM peak hour, the proposed project would not contribute to cause a hazardous condition at the San Fernando Road/Sheldon Street intersection and operational deficiencies at the Interstate (I) 5 northbound on-ramp–Rincon Avenue/Sheldon Street, I-5 northbound off-ramp–Jerome Street/Laurel Canyon Boulevard, and I-5 southbound ramps/Laurel Canyon Boulevard intersections.

Table 7. Peak Construction Year Weekday Peak Hour Intersection Level of Service

No.	Intersection	Control Type	LOS Method	Peak Construction				Peak Construction plus Project				Change in V/C or Delay	
				AM Peak		PM Peak		AM Peak		PM Peak			
				V/C [1] /Delay[2]	LOS	V/C [1] /Delay[2]	LOS	V/C [1] /Delay[2]	LOS	V/C [1] /Delay[2]	LOS	AM	PM
10.	I-5 NB ramps/Lankershim Boulevard	signalized	CMA	0.517	A	0.447	A	0.518	A	0.457	A	0.001	0.010
			HCM	19.2	B	15.9	B	19.2	B	16.0	B	0.00	0.10
11.	I-5 SB ramps/Lankershim Boulevard	signalized	CMA	0.456	A	0.395	A	0.456	A	0.395	A	0.000	0.000
			HCM	19.8	B	13.4	B	19.8	B	13.4	B	0.00	0.00

Notes: LOS = level of service; V/C = volume to capacity; CMA = LADOT CMA Methodology; I = Interstate; NB = Northbound; HCM = HCM Methodology (for Caltrans facilities); SB = Southbound.

[1] Volume-to-Capacity (V/C) ratio.

[2] Delay is calculated in seconds per vehicle.
